-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133).
- Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 07 December 2000.
- 2a) ☐ This action is FINAL. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-12 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-12 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☒ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 07 December 2000 is/are: a) ☐ accepted or b) ☒ objected to by the Examiner.
- Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
- Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. §§ 119 and 120

- 12) ☒ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☒ None of:
1. ☒ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
- * See the attached detailed Office action for a list of the certified copies not received.
- 13) ☐ Acknowledgment is made of a claim for domestic priority under 35 U.S.C. § 119(e) (to a provisional application) since a specific reference was included in the first sentence of the specification or in an Application Data Sheet. 37 CFR 1.78.
- a) ☐ The translation of the foreign language provisional application has been received.
- 14) ☐ Acknowledgment is made of a claim for domestic priority under 35 U.S.C. §§ 120 and/or 121 since a specific reference was included in the first sentence of the specification or in an Application Data Sheet. 37 CFR 1.78.

Attachment(s)

- 1) ☒ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☒ Information Disclosure Statement(s) (PTO-1449) Paper No(s) 5.
- 4) ☐ Interview Summary (PTO-413) Paper No(s). _____.
- 5) ☐ Notice of Informal Patent Application (PTO-152)
- 6) ☐ Other: _____.

DETAILED ACTION

Introduction

1. Claims 1-12 of U.S. Application 09/732,177 filed on 12/07/2000 are presented for examination.

Priority

2. Acknowledgment is made of applicant's claim for foreign priority based on an application filed in Japan on 12/07/1999. It is noted, however, that applicant has not filed a certified copy of the Japanese application as required by 35 U.S.C. 119(b).

Information Disclosure Statement

3. The listing of references in the specification is not a proper information disclosure statement. 37 CFR 1.98(b) requires a list of all patents, publications, or other information submitted for consideration by the Office, and MPEP § 609 A(1) states, "the list may not be incorporated into the specification but must be submitted in a separate paper." Therefore, unless the references have been cited by the examiner on form PTO-892, they have not been considered.
4. Applicants have provided (in paper #5) the article by R. Turner that is cited in p.1 of the specification, "A Target Field Approach to Optimal Coil Design", J. Phys. D. Appl. Phys. Vol. 19, 1986, pp. L147-151. However, Applicants have not provided

Art Unit: 2123

the paper by P. Mansfield and B. Chapman, "Multi-shield Active Magnetic Screening of Coil Structures in NMR", J. Magn. Reso. Vol.72, 1987, pp.211-223, which is also cited in p.1 of the specification. Examiner requests that the Applicant provides the Mansfield article.

Drawings

5. Figures 1-6 should be designated by a legend such as --Prior Art-- because only that which is old is illustrated. See MPEP § 608.02(g). A proposed drawing correction or corrected drawings are required in reply to the Office action to avoid abandonment of the application. The objection to the drawings will not be held in abeyance.

Specification

6. The specification is objected to because the term "Green function" should be "Green's function". Correction is required. See MPEP § 608.01(b).

Claim Objections

7. Claims 2, 3, 5, 8, 9, and 11 are objected to because of the following informalities: the term "Green function" should be "Green's function". Appropriate correction is required.

Claim Rejections - 35 USC § 112

8. Claims 1-12 are rejected under 35 U.S.C. 112, first paragraph, as failing to comply with the enablement requirement. The claim(s) contains subject matter which was not described in the specification in such a way as to enable one skilled in the art to which it pertains, or with which it is most nearly connected, to make and/or use the invention. The term "tightly wound" has not been defined in the specification. It is not clear what criteria differentiate "tightly wound" from "not tightly wound".
9. Claims 2, 3, 5, 8, 9, and 11 are rejected under 35 U.S.C. 112, first paragraph, as based on a disclosure which is not enabling. Steps critical or essential to the practice of the invention, but not included in the claim(s) is not enabled by the disclosure. See *In re Mayhew*, 527 F.2d 1229, 188 USPQ 356 (CCPA 1976). The claims are lacking a description of how Fourier components are used in combination with Green's theorem.

Claim Rejections - 35 USC § 103

10. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

11. The prior art used for these rejections is as follows:

12. Schenck, J.F. et al. "Formulation of Design Rules for NMR Imaging Coil by Using Symbolic Manipulation." Proc. of the 4th ACM Symposium on Symbolic and Algebraic Computation. 1981. pp.85-93. (Henceforth referred to as "**Schenck**").

13. Ishibashi, K. "Nonlinear Eddy Current Analysis by the Integral Equation Method." IEEE Transactions on Magnetics. Sept. 1994. Vol. 30, Issue 5. pp.3020-3023. (Henceforth referred to as "**Ishibashi**").

14. The claim rejections are hereby summarized for Applicant's convenience. The detailed rejections follow.

15. Claims 1-12 are rejected under 35 U.S.C. 103(a) as being unpatentable over Schenck in view of Ishibashi, and further in view of Official Notice.

16. In regards to claim 1:

1. A method of designing a magnetic field gradient coil assembly using tightly wound inner and outer coils, said method comprising the steps of:

- setting or resetting the number of said inner coils and optimizing their positions such that a resulting magnetic field strength falls within a tolerable range of a target magnetic field gradient under shielded conditions;
- setting or resetting the number of said outer coils and the number of turns of each outer coil;
- calculating Fourier components of an electric current distribution necessary for the outer coils;
- optimizing positions of the outer coils to approximate the Fourier components of the current distribution;
- calculating magnetic fields leaking from the inner and outer coils, respectively;
- calculating magnetic field distortions caused by eddy currents produced by the leaking magnetic fields; and
- resetting the number of the outer coils and the number of turns of each outer coil if the magnetic field distortions are outside the tolerable range.

Schenck teaches a method of designing a magnetic field gradient coil assembly using coils "... that will produce a given magnetic field." (Schenck, p.85, 1st para.). Schenck also teaches that "the natural mathematical approach to this problem is to introduce some form of series expansion of the field, wherein

the expansion coefficients are functions of the configuration of the coil.”

(Schenck, p.85, col.1, 2nd para.).

However, Shenck does not expressly teach:

- 1) the use of inner and outer coils,
- 2) that the resulting field strength “falls within a tolerable range of a target magnetic field gradient under shielded conditions”, as claimed,
- 3) setting a number of inner or outer coils, nor the number of turns of each coil,
- 4) the use of Fourier components,
- 5) the calculation of leaking fields,
- 6) field distortions caused by eddy currents, nor
- 7) resetting the number of outer coils and number of turns of each outer coil if the magnetic field distortions are outside the tolerable range.

Ishibashi, on the other hand, does teach the features 2) –7) listed immediately above (See Ishibashi, Abstract and “I. Introduction”). More specifically, Ishibashi teaches “surface magnetic fields given as boundary values”. This is element 2). Ishibashi also teaches that “...the quantities are expanded by Fourier series...” This is element 4). Ishibashi also teaches “surface and internal [magnetic] fields”, that are equivalent to the “leaked fields” in feature 5). Ishibashi also teaches the field effects of eddy currents. This is element 6).

Ishibashi also teaches that the technique is “iterative”. (See Ishibashi, “I. Introduction”), therefore teaching the “setting” and “resetting” components of features 3) and 7) listed immediately above. Moreover, it is inherent that the

number of coils, and the number of turns per coil, will have an effect on the EMF, and therefore that these will be the parameters that are adjusted.

It would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the teachings of Schenck with those of Ishibashi because "the boundary element method (BEM) has been widely used for analyzing open boundary eddy current problems" and "... it is well known that even BEM can be applied to the analysis of nonlinear problems." (See Ishibashi, "I. Introduction").

Official Notice is given that it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the teachings of Schenck by using inner and outer coils, (as claimed in feature 1) of the list of features not taught by Schenck), because doing so would enable creating EMF patterns that cannot be created by using only one layer of coils.

17. In regards to claim 2:

2. A method of designing a magnetic field gradient coil assembly as set forth in claim 1, wherein said step of setting or resetting the number of said inner coils and optimizing their positions such that a resulting magnetic field strength falls within a tolerable range of a target magnetic field gradient under shielded conditions uses a Green function.

Schenck does not expressly teach the use of Green's theorem in order to set, reset, and optimize the positions of the inner coils.

Ishibashi, on the other hand, does expressly teach this. (See Ishibashi, Abstract, "I. Introduction").

It would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the teachings of Schenck with those of Ishibashi

because “the boundary element method (BEM) has been widely used for analyzing open boundary eddy current problems” and “... it is well known that even BEM can be applied to the analysis of nonlinear problems.” (See Ishibashi, “I. Introduction”).

19. In regards to claim 3:

3. A method of designing a magnetic field gradient coil assembly as set forth in claim 1, wherein said step of calculating Fourier components of an electric current distribution necessary for the outer coils uses a Green function.

Schenck does not expressly teach the use of Green's theorem in order to set, reset, and optimize the positions of the outer coils.

Ishibashi, on the other hand, does expressly teach this. (See Ishibashi, Abstract, “I. Introduction”).

It would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the teachings of Schenck with those of Ishibashi because “the boundary element method (BEM) has been widely used for analyzing open boundary eddy current problems” and “... it is well known that even BEM can be applied to the analysis of nonlinear problems.” (See Ishibashi, “I. Introduction”).

21. In regards to claim 4:

4. A method of designing a magnetic field gradient coil assembly as set forth in claim 1, wherein said step of optimizing the positions of the outer coils to approximate the Fourier components of the current distribution performs the approximation using a small number of tightly wound coils.

While Schenck teaches that “... the natural mathematical approach to this problem is to introduce some form of series expansion of the field, wherein the

expansion coefficients are functions of configuration of the coil.” (See Schenck, p.85, col.1, 2nd para.). However, Schenck does not expressly teach the use of the Fourier series or Fourier components.

Ishibashi, on the other hand, does expressly teach the use of Fourier series, to model the “periodic electromagnetic quantities in the conductor”. (See Ishibashi, Abstract, “I. Introduction”). It is inherent in a Fourier series that each additional element produces diminishing improvements in the results.

It would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the teachings of Schenck with those of Ishibashi because “the boundary element method (BEM) has been widely used for analyzing open boundary eddy current problems” and “... it is well known that even BEM can be applied to the analysis of nonlinear problems.” (See Ishibashi, “I. Introduction”).

23. In regards to claim 5:

5. A method of designing a magnetic field gradient coil assembly as set forth in claim 1, wherein said step of calculating magnetic fields leaking from the inner and outer coils, respectively, and said step of calculating magnetic field distortions caused by eddy currents produced by the leaking magnetic fields use a Green function.

Schenck does not expressly teach the use of Green’s theorem in order to calculate magnetic field distortions caused by eddy currents.

Ishibashi, on the other hand, does expressly teach this. (See Ishibashi, Abstract, “I. Introduction”).

It would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the teachings of Schenck with those of Ishibashi

Art Unit: 2123

because “the boundary element method (BEM) has been widely used for analyzing open boundary eddy current problems” and “... it is well known that even BEM can be applied to the analysis of nonlinear problems.” (See Ishibashi, “I. Introduction”).

24. In regards to claim 6:

6. A method of designing a magnetic field gradient coil assembly as set forth in claim 1, wherein said step of resetting the number of the outer coils and the number of turns of each outer coil if the magnetic field distortions are outside the tolerable range, said step of calculating Fourier components of an electric current distribution necessary for the outer coils, said step of optimizing the positions of the outer coils to approximate the Fourier components of the current distribution, said step of calculating magnetic fields leaking from the inner and outer coils, respectively, and said step of calculating magnetic field distortions caused by eddy currents produced by the leaking magnetic fields are repeatedly carried out to determine optimum conditions for the outer coils by trial and error.

Schenck does not expressly teach that the steps are repeatedly carried out to determine the optimum conditions.

Ishibashi, however, teaches that the technique is “iterative”. (See Ishibashi, “I. Introduction”).

It would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the teachings of Schenck with those of Ishibashi because “the boundary element method (BEM) has been widely used for analyzing open boundary eddy current problems” and “... it is well known that even BEM can be applied to the analysis of nonlinear problems.” (See Ishibashi, “I. Introduction”).

25. In regards to claim 7:

7. A magnetic field gradient coil assembly having tightly wound inner and outer coils, said magnetic field gradient coil assembly having been designed by a method comprising the steps of:

setting or resetting the number of said inner coils and the number of turns of each inner coil and optimizing their positions such that a resulting magnetic field strength falls within a tolerable range of a target magnetic field gradient under shielded conditions;

setting the number of said outer coils and the number of turns of each outer coil;
calculating Fourier components of an electric current distribution necessary for the outer coils;

optimizing positions of the outer coils to approximate the Fourier components of the current distribution;

calculating magnetic fields leaking from the inner and outer coils, respectively; and
resetting the number of the outer coils and the number of turns of each outer coil if the magnetic field distortions are outside the tolerable range.

Schenck teaches a method of designing a magnetic field gradient coil assembly using coils "... that will produce a given magnetic field." (Schenck, p.85, 1st para.). Schenck also teaches that "the natural mathematical approach to this problem is to introduce some form of series expansion of the field, wherein the expansion coefficients are functions of the configuration of the coil." (Schenck, p.85, col.1, 2nd para.).

However, Schenck does not expressly teach:

- 1) the use of inner and outer coils,
- 2) that the resulting field strength "falls within a tolerable range of a target magnetic field gradient under shielded conditions", as claimed,
- 3) setting a number of inner or outer coils, nor the number of turns of each coil,
- 4) the use of Fourier components,
- 5) the calculation of leaking fields,
- 6) field distortions caused by eddy currents, nor
- 7) resetting the number of outer coils and number of turns of each outer coil if the magnetic field distortions are outside the tolerable range.

Ishibashi, on the other hand, does teach the features 2) –7) listed immediately above (See Ishibashi, Abstract and “I. Introduction”). More specifically, Ishibashi teaches “surface magnetic fields given as boundary values”. This is element 2). Ishibashi also teaches that “...the quantities are expanded by Fourier series...” This is element 4). Ishibashi also teaches “surface and internal [magnetic] fields”, that are equivalent to the “leaked fields” in feature 5). Ishibashi also teaches the field effects of eddy currents. This is element 6).

Ishibashi also teaches that the technique is “iterative”. (See Ishibashi, “I. Introduction”), therefore teaching the “setting” and “resetting” components of features 3) and 7) listed immediately above. Moreover, it is inherent that the number of coils, and the number of turns per coil, will have an effect on the EMF, and therefore that these will be the parameters that are adjusted.

It would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the teachings of Schenck with those of Ishibashi because “the boundary element method (BEM) has been widely used for analyzing open boundary eddy current problems” and “... it is well known that even BEM can be applied to the analysis of nonlinear problems.” (See Ishibashi, “I. Introduction”).

Official Notice is given that it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the teachings of Schenck by using inner and outer coils, (as claimed in feature 1) of the list of

features not taught by Schenck), because doing so would enable creating EMF patterns that cannot be created by using only one layer of coils.

31. Claims 8-12 are rejected based on the same reasoning as claims 2-6.

Claims 8-12 are magnetic field gradient coil assembly claims reciting the equivalent limitations as are recited in method claims 2-6 and taught throughout Schenck and Ishibashi.

Conclusion

32. The following prior art, made of record and not relied upon, is considered pertinent to applicant's disclosure.
